SUBJECT: Estimating Historical Costs of Capital Assets Using the Consumer Price Index

Summary

Political subdivisions reporting in accordance with Generally Accepted Accounting Principles may have to calculate the historical cost of a capital asset. Listed below is the consumer price index (CPI) for years ranging from 1935 to 2018 that may be used for such calculations. Please note that the base year of the index is "1967" (at 100.0). This should not be confused with the consumer price index used for computing the change in compensation for a variety of local government officials which uses "1982" as its base year.

The formula to compute the estimated historical cost of an asset using the CPI is as follows:

Estimated Current Historical Cost	x	Index Rate for Estimated Year of Acquisition	÷	Index Rate for Current Year	=	Estimate Cost
--	---	---	---	--	---	--------------------------

Example: The estimated or actual year of acquisition of an asset is 1950. The purchase price of the same asset in 2018 is \$91,500. The estimated historical cost would be computed as follows:

$$\$91,500 \times 72.1 \div 752.2 = \$8,770$$
